

THAT WHICH IS CLAIMED IS:

1. A bipolar structure comprising:

a silicon carbide substrate;

a voltage blocking region on said substrate;

5 respective p-type and n-type silicon carbide regions bounding said voltage blocking region; wherein at least one of said p-type region and said n-type region has a thickness greater than the minority carrier diffusion length in that region.

2. A bipolar structure according to Claim 1 wherein said substrate, said voltage
10 blocking region and said p-type and n-type regions all have the same polytype.

3. A bipolar structure according to Claim 2 wherein said substrate has a polytype selected from the group consisting of the 3C, 4H, 6H and 15R polytype of silicon carbide.

15 4. A bipolar structure according to Claim 1 wherein said bipolar structure forms a portion of a device selected from the group consisting of p-n junction diodes, p-i-n diodes, bipolar transistors, and thyristors.

20 5. A bipolar structure according to Claim 1 further comprising at least one stacking fault, and wherein those portions of those stacking faults that grow under forward bias operation are segregated from at least one of the interfaces between the p-type region or the n-type region and a portion of the device structure other than the voltage blocking region.

25 6. A bipolar structure according to Claim 1 further comprising at least one stacking fault, and wherein said stacking fault is segregated from any portion of the device that has a sufficient defect density or stress state to support the growth of the stacking fault under forward bias operation of the device.

7. A p-n diode comprising:

30 a silicon carbide substrate;

an n+ region of silicon carbide on said substrate;
an n- voltage blocking region of silicon carbide on said n+ region;
a p region of silicon carbide on said n- region;
wherein at least one of said p region and said n+ region has a thickness greater than
5 the minority carrier diffusion length in said region.

8. A p-n diode according to Claim 7 wherein said substrate, said voltage blocking
region and said p-type and n-type regions all have the same polytype.

10 9. A p-n diode according to Claim 8 wherein said substrate has a polytype selected
from the group consisting of the 3C, 4H, 6H and 15R polytypes of silicon carbide.

10. A p-n diode according to Claim 7 wherein said n+ region is about 2.5 microns
thick and has a carrier concentration of between about 1×10^{18} and $1 \times 10^{19} \text{ cm}^{-3}$.

15 11. A p-n diode according to Claim 7 wherein said n+ region is about 0.5 microns
thick and has a carrier concentration of about $2 \times 10^{18} \text{ cm}^{-3}$.

20 12. A p-n diode according to Claim 7 wherein said p-type region is greater than
about 0.5 microns thick and has a carrier concentration of between about 1×10^{17} and $1 \times 10^{19} \text{ cm}^{-3}$.

25 13. A p-n diode according to Claim 7 wherein said p-type region includes a contact
layer having a thickness of about 2 microns and a carrier concentration of about $1 \times 10^{19} \text{ cm}^{-3}$.

14. A p-n diode according to Claim 7 wherein said p-type region has a carrier
concentration about 2 orders of magnitude greater than said n- region.

15. A p- n diode according to Claim 7 and further comprising a p-type contact layer between said ohmic contact and said p-type region, with said contact layer having a higher carrier concentration than said p-type region.

5 16. A p- n diode according to Claim 15 wherein said contact layer has a carrier concentration of at least about $1 \times 10^{19} \text{ cm}^{-3}$, but less than the amount that would result in a decrease in crystal quality that would degrade the performance of the diode, and a thickness of at least about 1000 angstroms.

10 17. A p- n diode according to Claim 7 wherein said substrate has a carrier concentration of between about 5×10^{18} and $2 \times 10^{19} \text{ cm}^{-3}$ and is at least about 125 microns thick.

15 18. A p- n diode according to Claim 7 wherein:
said p-type region is about 0.5 microns thick and has a carrier concentration of about $1 \times 10^{18} \text{ cm}^{-3}$;

said n- region is about 45 microns thick and has a carrier concentration of about $1 \times 10^{15} \text{ cm}^{-3}$;

20 said n+ region is about 0.5 microns thick and has a carrier concentration of about $2 \times 10^{18} \text{ cm}^{-3}$;

and further comprising a p+ -type contact layer between said p-type region and said ohmic contact, said contact layer being about 2 microns thick and having a carrier concentration of about $1 \times 10^{19} \text{ cm}^{-3}$.

25 and further comprising a n+ -type boundary layer between said n-type region and said substrate, said boundary layer being about 2 microns thick and having a carrier concentration of about $1 \times 10^{19} \text{ cm}^{-3}$.

19. A p-n diode according to Claim 7 further comprising at least one planar defect, and wherein those portions of those stacking faults that grow under forward bias operation

are segregated from at least one of the interfaces between the n⁺ region or the p-type region and the remainder of the device.

20. A p-n diode according to Claim 7 further comprising at least one planar defect,
5 and wherein said planar defect is segregated from any portion of the device that has a sufficient defect density or stress state to support the growth of the stacking fault under forward bias operation of the device.

21. A bipolar device comprising:
10 a silicon carbide substrate;
a voltage blocking region on said substrate;
respective p-type and n-type silicon carbide regions bounding said voltage blocking region; wherein those portions of those stacking faults that grow under forward bias operation are segregated from at least one of the interfaces between the bounding regions and
15 the remainder of the device.

22. A bipolar device according to Claim 21 selected from the group consisting of p-i-n diodes, p-n junction diodes, bipolar transistors, and thyristors.

20 23. A bipolar device according to Claim 21 wherein said p and n regions have the same polytype.

25 25. A bipolar device according to Claim 24 wherein said substrate and said p and n regions have the same polytype.

26. A bipolar device according to Claim 25 wherein said polytype is selected from the group consisting of the 3C, 4H, 6H and 15R polytypes of silicon carbide.

27. A bipolar device according to Claim 21 wherein those portions of those stacking faults that grow under forward bias operation are segregated from the interfaces between the bounding regions and the remainder of the device.

5 28. A bipolar device according to Claim 4 wherein at least one of said p-type region and said n-type region has a thickness greater than the minority carrier diffusion length in that layer.

10 29. A bipolar device comprising:
at least one p-type region;
at least one n-type region; and
at least one stacking fault;
said stacking fault being segregated from any portion of the device that has a
sufficient defect density or stress state to support the growth of the stacking fault under
15 forward bias operation of the device.

20 30. A bipolar device according to Claim 29 selected from the group consisting of p-i-n diodes, p-n junction diodes, bipolar transistors, and thyristors.

25 31. A bipolar device according to Claim 29 wherein said p and n regions have the same polytype.

 32. A bipolar device according to Claim 29 and further comprising a silicon carbide substrate.

 33. A bipolar device according to Claim 32 wherein said substrate and said p and n regions have the same polytype.

30 34. A bipolar device according to Claim 33 wherein said polytype is selected from the group consisting of the 3C, 4H, 6H and 15R polytypes of silicon carbide.

35. A bipolar device according to Claim 29,
further comprising an active region including said p-type region and said n-type
region, said p-type region and said n-type region forming boundary regions of said active
5 region; and

wherein those portions of those stacking faults that grow under forward bias operation
are segregated from the interfaces between the active region and the remainder of the device.

36. A bipolar device according to Claim 29 wherein said p-type layer and said n-type
10 layer each have a thickness greater than the minority carrier diffusion length in that layer.

37. A bipolar device in silicon carbide wherein the thickness of any terminating layer
is greater than the minority carrier diffusion length in that layer.

38. A bipolar device according to Claim 37 wherein said terminating layers comprise
15 an epitaxial layer adjacent a substrate and an epitaxial layer adjacent an ohmic contact.

39. A bipolar device according to Claim 38 wherein said terminating layers comprise
at least one n-type layer and at least one p-type layer, and wherein said epitaxial layers and
20 said substrate all have the same polytype.

40. A bipolar device according to Claim 37 wherein said polytype is selected from
the group consisting of the 3C, 4H, 6H, and 15R polytypes of silicon carbide.

41. A bipolar device according to Claim 37 selected from the group consisting of p-n
25 junction diodes, p-i-n diodes; bipolar transistors, and thyristors.

42. A bipolar device according to Claim 37 that includes at least one stacking fault
and wherein those portions of those stacking faults that grow under forward bias operation

are segregated from at least one of the interfaces between the active region and the remainder of the device.

43. A bipolar device according to Claim 37 that includes at least one stacking fault
5 and wherein said stacking fault is segregated from any portion of the device that has a sufficient defect density or stress state to support the growth of the stacking fault under forward operation of the device.

44. A bipolar device formed in silicon carbide and within which continued growth of
10 stacking faults is hindered by providing at least one highly doped layer in which an edge of a stacking fault will tend to terminate.

45. A bipolar device according to Claim 44 that includes a stacking fault having an
15 edge that terminates in a layer having a carrier concentration of at least about $5 \times 10^{18} \text{ cm}^{-3}$.

46. A bipolar junction transistor comprising:
a silicon carbide substrate;
an n⁺ buffer layer on said substrate;
an n⁻ region on said buffer layer;
20 a p-type base region adjacent said n⁻ region;
an n⁺ emitter region adjacent said base region;
an ohmic contact deposited on said emitter region;
wherein at least one of said emitter region and said buffer layer has a thickness
greater than the minority carrier diffusion length in that layer.

25

47. A thyristor comprising:
a silicon carbide substrate;
an n⁺ buffer layer on said substrate;
30 a p⁻ region on said buffer layer;
an n-type region adjacent said p⁻ region;

a p+ anode region adjacent said n-type region;
an ohmic contact deposited on said anode region;
wherein at least one of said anode region and said buffer layer has a thickness greater than the minority carrier diffusion length in that layer.

5

48. A field controlled thyristor comprising:

a silicon carbide substrate;

an n+ buffer layer on said substrate;

a p- drift region on said buffer layer;

a p+ anode region on said p- drift region; and

an ohmic contact deposited on said anode region;

wherein at least one of said anode region and said buffer layer has a thickness greater than the minority carrier diffusion length in that layer.

10

15

49. A p-n diode according to Claim 10 wherein said n+ region comprises a first n+ region having a thickness of about 0.5 microns and a carrier concentration of about $2 \times 10^{18} \text{ cm}^{-3}$ and a second n+ region having a thickness of about 2.0 microns and a carrier concentration of about $1 \times 10^{19} \text{ cm}^{-3}$.

20

50. A p-n diode according to Claim 10 wherein said n+ region has a thickness of about 2.5 microns and a carrier concentration of about $2 \times 10^{18} \text{ cm}^{-3}$.

51. A p-n diode according to claim 20, wherein the planar defect is a stacking fault.
